## 2). The ForeseeHome device will be the new standard of care in AMD monitoring

Described in one of my previous articles as one of the 5 greatest ophthalmic innovations of the 21<sup>st</sup> century, telemedicine represents a new frontier of our field focusing on two main principles: prevention and early disease detection. This philosophy is probably best illustrated in a disease like AMD, and the ForeseeHome device (Notal Vision) is the flagship telemedicine technology in ophthalmology today. The ability to immediately detect the initial conversion in a patient from dry to wet AMD is absolutely critical and basically determines a patient's visual prognosis in addition to making our current therapies even more effective. Top that off with the recent Medicare coverage approval for the device and I believe ForeseeHome utilization will accelerate this year and become the new standard of care in AMD monitoring.
